# Черно-серебряная мульчирующая пленка

The front of this product is silver, and the back is black. When covering, the silver side faces up and the black side faces down. This can not only achieve the effect of heat preservation and humidification of the original white and black mulch film when the ground temperature is low in winter and spring, but also reflect sunlight and reduce the ground temperature in summer and autumn high temperature seasons to promote the development of plant roots. The silver surface of the mulch film can reflect more than 80% of sunlight. During the reflection process, the back of the middle and lower leaves of the crops will be fully reflected light, which greatly reduces the incidence of old leaves in the middle and lower parts of the plant. In addition, pests such as lice and aphids who like to feed on the back of leaves are most afraid of silver-white light, which can greatly reduce the incidence of such pests. The black opaque back side can make the occurrence rate of weeds under the film almost zero. Because of its unique technology, the mulch film can be recycled after the crops are harvested to avoid pollution to the land.
